Both the Zimbardo and Wilson articles extoll the contributions of psychology. The Wilson article, in particular, advocates for application of the experimental methodology developed by social psychology as a way to *objectively* evaluate the effectiveness of interventions and of determining causal factors in behavior.

Based on our discussion in class, and on the points raised by Jonathan Haidt, is psychology really an objective science? If not, what can be done to make it more so? How can biases affect the science?

In answering this question, be sure to support your position with evidence from the assigned articles. Your answer should be 2 typed pages, 12 font or smaller. There is no need to include a formal citations page, but you should identify the article and author in your text.
